

10 - Searching & Sorting

For example:

Input	Result
5 6 5 4 3 8	3 4 5 6 8

Ex. No. : 10.1

Date:

Register No.:

Name:

Merge Sort

Write a Python program to sort a list of elements using the merge sort algorithm.

Program:

```
def merge_sort(arr):
    if len(arr) <= 1:
        return arr

    mid = len(arr) // 2
    left_half = merge_sort(arr[:mid])
    right_half = merge_sort(arr[mid:])

    return merge(left_half, right_half)

def merge(left, right):
    sorted_arr = []
    i = j = 0
    while i < len(left) and j < len(right):
        if left[i] < right[j]:
            sorted_arr.append(left[i])
            i += 1
        else:
            sorted_arr.append(right[j])
            j += 1
    sorted_arr.extend(left[i:])
    sorted_arr.extend(right[j:])
    return sorted_arr

x = int(input("Enter the number of elements: "))
y = [int(i) for i in input("Enter the elements separated by spaces: ").split()]

sorted_list = merge_sort(y)
print("Sorted list:", sorted_list)
```

Input Format

The first line contains an integer, n , the size of the [list](#) a .
The second line contains n , space-separated integers $a[i]$.

Constraints

- $2 \leq n \leq 600$
- $1 \leq a[i] \leq 2 \times 10^6$.

Output Format

You must print the following three lines of output:

1. [List](#) is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
2. First Element: firstElement, the *first* element in the sorted [list](#).
3. Last Element: lastElement, the *last* element in the sorted [list](#).

Sample Input 0

3
1 2 3

Sample Output 0

[List](#) is sorted in 0 swaps.
First Element: 1
Last Element: 3

For example:

Input	Result
3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3
5 1 9 2 8 4	List is sorted in 4 swaps. First Element: 1 Last Element: 9

Ex. No. : 10.2

Name:

Bubble Sort

Given an list of integers, sort the array in ascending order using the *Bubble Sort* algorithm above. Once sorted, print the following three lines:

1. [List](#) is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
2. First Element: firstElement, the *first* element in the sorted [list](#).
3. Last Element: lastElement, the *last* element in the sorted [list](#).

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

Array is sorted in 3 swaps.

First Element: 1

Last Element: 6

Program:

```
def bubble_sort(arr):
    n = len(arr)
    num_swaps = 0
    for i in range(n):
        for j in range(n - 1):
            if arr[j] > arr[j + 1]:
                arr[j], arr[j + 1] = arr[j + 1], arr[j]
                num_swaps += 1
    return num_swaps

n = int(input(""))
arr = list(map(int, input("").split()))

num_swaps = bubble_sort(arr)

print(f"List is sorted in {num_swaps} swaps.")
print(f"First Element: {arr[0]}")
print(f>Last Element: {arr[-1]}")
```

Input Format

The first line contains a single integer n , the length of A .
The second line contains n space-separated integers, $A[i]$.

Output Format

Print peak numbers separated by space.

Sample Input

5
8 9 10 2 6

Sample Output

10 6

For example:

Input	Result
4 12 3 6 8	12 8

Ex. No. : 10.3

Name:

Peak Element

Given an list, find peak element in it. A peak element is an element that is greater than its neighbors.

An element $a[i]$ is a peak element if

$A[i-1] \leq A[i] \geq A[i+1]$ for middle elements. $[0 < i < n-1]$

$A[i-1] \leq A[i]$ for last element $[i=n-1]$

$A[i] \geq A[i+1]$ for first element $[i=0]$

Program:

```
n = int(input(""))
arr = list(map(int, input("").split()))

peaks = []

if n > 1 and arr[0] >= arr[1]:
    peaks.append(arr[0])

for i in range(1, n - 1):
    if arr[i - 1] <= arr[i] >= arr[i + 1]:
        peaks.append(arr[i])

if n > 1 and arr[-1] >= arr[-2]:
    peaks.append(arr[-1])

print(" ".join(map(str, peaks)))
```

For example:

Input	Result
1 2 3 5 8 6	False
3 5 9 45 42 42	True

Name:

Binary Search

Write a Python program for binary search.

Program:

```
a=input()
b=[int(num) for num in a.split(",")]
c=int(input())
if c not in b:
    print("False")
else:
    print("True")
```

Input:

1 68 79 4 90 68 1 4 5

output:

1 2

4 2

5 1

68 2

79 1

90 1

For example:

Input	Result
4 3 5 3 4 5	3 2 4 2 5 2

Ex. No. : 10.5

Name:

Frequency of Elements

To find the frequency of numbers in a list and display in sorted order.

Constraints:

$1 \leq n$, $\text{arr}[i] \leq 100$

Program:

```
arr = list(map(int, input().split()))

frequency = {}
for num in arr:
    frequency[num] = frequency.get(num, 0) + 1

sorted_frequency = sorted(frequency.items())

for num, freq in sorted_frequency:
    print(num, freq)
```
